Triad®
Hydrophillic wound dressing

A unique approach
to wound management
Impact of difficult-to-dress wounds

On wet or irregular surfaces, wound dressings may not always stay in place. Frequent dressing replacements could lead to:

- Avoidable costs related to using extra dressings
- Increased workload for nurses replacing dressings
- Delayed wound healing impacting the total cost of care

Did you know?

57% of wound care nurses see difficult-to-dress wounds every day¹

How do difficult-to-dress wounds impact your facility?

A unique approach

Triad® Hydrophillic Wound Dressing is a sterile coating that offers a unique approach to wound management.

- **Apply anywhere**
  - Triad is easy to apply, directly from the tube onto the wound or peri-wound skin, anywhere on the body.

- **Adheres to wet skin**
  - Triad adheres to wet or dry skin and consistently stays in place, even in the presence of incontinence or maceration.

- **Keeps the wound covered**
  - Triad creates a moist wound environment that facilitates healing and autolytic debridement.

"With Triad, we've saved significantly and had better outcomes. We don't need a nurse to change the dressing every day and that's had a big impact on saving time and material."

H Kirkland-Khyn, Director of Wound Care, University of California, Davis, Medical Center

What do you currently use for difficult-to-dress wounds?
How Triad® works

**Wounds on irregular surfaces**

Triad is designed to be applied directly from the tube onto the wound without the need for a secondary dressing.

Irregular surfaces could include the gluteal cleft, coccyx, perineum, buttocks, groin, face, hands, feet and other areas.

Triad is easy to apply, and can be used on the wound or peri-wound skin.

**Maceration of peri-wound skin**

CMC allows Triad to adhere to macerated skin, keeping it covered and protected from wound exudate.

Triad contains dimethicone to moisturize the skin and petrolatum and zinc oxide to reduce skin irritation.

**Broken skin in the presence of incontinence**

Triad is a sterile coating that can be used on broken skin.

CMC allows Triad to adhere to wet skin, keeping the wound covered and protected from incontinence.

Triad contains dimethicone to moisturize the skin and petrolatum and zinc oxide to reduce skin irritation.

**Necrotic tissue such as slough or eschar**

Triad’s hydrophilic, which means that natural moisture spreads evenly across the wound surface, maximizing contact and creating a moist environment.

A moist wound environment facilitates autolytic debridement, where the body’s own enzymes break down necrotic tissue.

CMC allows Triad to absorb low to moderate levels of wound exudate or broken down tissue.

**Necrosis is a barrier to wound healing**

In one case, Triad debrided 100% thick black eschar within one week.

**Impact of difficult-to-dress wounds**

On wet or irregular surfaces, wound dressings may not always stay in place. Frequent dressing replacements could lead to:

- Avoidable costs related to using extra dressings
- Increased workload for nurses replacing dressings
- Delayed wound healing impacting the total cost of care
